

## SWOT analysis of Adaptive Cruise Control (ACC)

Strengths	Weaknesses
<ul style="list-style-type: none"> <li>- Autonomy in that all necessary technology and intelligence is available on board</li> <li>- Increases safety and comfort</li> <li>- Smoothens traffic flow</li> <li>- Decreases fuel consumption</li> <li>- Decreases environmental pollution</li> <li>- Capacity increase under short gaps</li> <li>- Enables forming of vehicle platoons</li> </ul>	<ul style="list-style-type: none"> <li>- Autonomy implies that network-wide beneficial settings cannot be directly communicated and/or imposed</li> <li>- Capacity decrease under conservative gaps</li> <li>- On-ramp flow merging problems under short gaps and high penetration rates</li> <li>- Limited speed-range operation</li> <li>- Control laws that do not ensure traffic flow stability under all circumstances</li> </ul>
Opportunities	Threats
<ul style="list-style-type: none"> <li>- Advice/recommendations on network-wide beneficial system settings via traditional VMS or navigation devices or build-in (autonomous) extensions</li> <li>- Enabling network-wide beneficial system settings via V2I communication</li> <li>- LSACC/FSRA extend speed-range operation, thus applicability to all traffic conditions</li> <li>- CACC enables even shorter gaps</li> <li>- V2V and/or V2I communication may assist and smooth on-ramp merging flows</li> <li>- Control-theoretical research may provide more efficient control laws</li> <li>- Technology maturity may reduce system cost</li> </ul>	<ul style="list-style-type: none"> <li>- User acceptance in terms of both purchase intention and frequent activation after purchase</li> <li>- Cost</li> <li>- Motorway traffic management delayed adaptation</li> </ul>
